

FINAL PRESENTATION | GROUP 3

E-Commerce Marketplace Performance

Orders, delivery reliability,
customer satisfaction and growth

DECISION OBJECTIVE

**Grow the marketplace
without breaking the
customer experience.**

[FULL NAME] · [FULL NAME] · [FULL NAME]
[FULL NAME] · [FULL NAME]

How can the marketplace expand orders, sellers and catalogue breadth while protecting delivery reliability and customer satisfaction?

1 Measure

Order journey

2 Diagnose

Failure signals

3 Prioritize

Volume × risk

4 Act

Guardrailed growth

CORE MESSAGE Delivery reliability is the clearest operational signal associated with customer dissatisfaction.

A relational view of the full marketplace journey

- | | | |
|----|------------------------|--------------------------------------|
| 01 | Define grain | Order, item, customer and seller |
| 02 | Join safely | Explicit keys and cardinality checks |
| 03 | Derive measures | Delay, lateness, revenue and risk |
| 04 | Validate | Independent scripts and denominators |

DATA SCOPE

10

related source
tables

99,441

orders

112,650

order-item rows

96,096

unique customers

3,095

sellers

74

normalized
categories

The marketplace achieved meaningful scale, with demand accelerating into late 2017.

Monthly order volume

99,441

orders

32,951

products

3,095

sellers

Most orders are delivered and most reviews are positive, but aggregate success hides service failures.

Order status distribution

Review score distribution

4.09 average review | 77.1% of reviews are 4–5 stars

Late delivery is the strongest operational warning signal in the analysis.

12.6 days

average delivered time

8.1%

late-delivery rate

52.8%

low reviews when late

Review outcome: on-time versus late delivery

Only 9.1% of on-time delivered orders receive a low review.

Prioritize segments where commercial importance and service risk overlap.

CATEGORY SCREEN

- Rank by demand and revenue
- Overlay review and late-delivery risk
- Separate scale from intervention
- Avoid decisions from small samples

SELLER SEGMENTATION

Use minimum-volume thresholds and compare delivery, lateness and review outcomes before promoting or intervening.

DECISION RULE

**Scale proven healthy sellers.
Intervene where volume magnifies service risk.**

Demand is concentrated, so risk ranking must account for both volume and delivery performance.

Demand concentration by state

Demand versus service risk

Use a volume × risk screen to distinguish national priorities from noisy low-volume outliers.

Growth decisions need service guardrails and careful interpretation of acquisition data.

MQL-to-seller conversion by origin

INTERPRETATION

- Compare equal windows
- Separate lead and seller grain
- Flag missing attribution
- Do not infer causality
- Scale only healthy categories

Marketing linkage is directional context, not a complete attribution model.

1 **Protect the promise** Monitor late delivery and review impact weekly

2 **Target overlap** Intervene in high-volume, high-risk segments

3 **Scale healthy segments** Grow where demand and service quality are proven

4 **Improve matching** Shorten fulfilment distance where possible

5 **Repair attribution** Strengthen MQL-to-seller linkage before budget shifts

WHAT THE DATA CANNOT PROVE

- Relationships are not causal effects
- Reviews are incomplete for some orders
- Some delivery sequences are invalid
- Revenue is not profit
- Marketing linkage is incomplete

NEXT IMPROVEMENTS

- Track complete-attribution cohorts
- Add confidence and sample-size flags
- Model delivery drivers
- Add repeat-customer and profit views
- Operationalize threshold alerts

Use the dashboard as a decision aid, not as proof of causality.

Scale is sustainable only when delivery reliability and customer experience improve with it.

Measure the journey → prioritize volume × risk → act with guardrails
